HANNIBAL — COMPLETE PROJECT ROADMAP

Original terminal through portable transmission-network forecasting

Purpose

A decision-support platform to reduce information asymmetry by connecting real observations to network transmission, friction and calibrated forecasts. It cannot guarantee profits or protection from losses.

Stage	Name	Scope
0	Original	Markets, news, kinetic strikes, prediction UI, DART/subsea, maps, graphs, weather and infrastructure.
1	Preserve & secure	Harden storage, network handling, audit and executable trust without breaking feeds or displays.
2	Friction engine	Validated, deduplicated, confidence/freshness-weighted bounded domain states and interactions.
3	Country matrix	Country markets, headlines, weather, telecom, infrastructure, conflict and local C_t.
4	Satellite/weather	Fire, flood, thermal, vegetation, night-light, storm and station observations.
5	Telecom	BGP, IXP, DNS, mobile, backbone, cables, satellites and topology risk.
6	Kinetic reintegration	Strikes, naval events, blockades, mobilization and exposure channels.
7	Prediction restoration	Fitted asset/horizon models, error gates and deterministic signals.
8	Transmission networks	Maritime delays, chokepoints, ports, insurance, pipelines, LNG, rail and air cargo.
9	Portable operation	Speed modes 1–5; Windows/Linux launchers; offline and emergency operation.
10	Production calibration	Historical warehouse, expansion-window tests, baselines, registry, drift and promotion gates.

Preservation rules

• Keep DART/subsea nodes, maps, graphs, country selectors, headlines, markets, weather, satellites, telecom, kinetic monitoring and prediction.

• Security failures must be visible degraded states; never silently fabricate replacement data.

Evidence pipeline

• Source → validation → canonical event → deduplication → corroboration → freshness → geography/network mapping → domain state.

• Always report estimate, confidence, freshness, source count and quality flags separately.

Domains

• Energy, transport, money, labor, infrastructure, weather, conflict, markets, telecom, kinetic, maritime, pipeline, port, rail, air cargo, insurance and logistics delay.

Country intelligence

• Selection updates local markets, headlines, weather, satellite, telecom, logistics and C_t together.

• Global observations may propagate locally according to exposure; inferred geography carries lower confidence.

Transmission graph

• Kinetic shock → energy/infrastructure exposure → chokepoint/pipeline/port impairment → transit delay/insurance → energy logistics → inflation/assets.

• Critical chokepoints: Hormuz, Suez, Panama, Bab el-Mandeb, Malacca, Bosporus, Gibraltar and English Channel.

Forecasting

• Fit separate assets and horizons from real historical forward returns.

• Suppress BUY/SELL when predicted magnitude does not exceed model RMSE or threshold.

• LLM explains structured output only; it cannot calculate or override.

Portable profiles

• 1 Full; 2 Balanced; 3 Legacy Hardware; 4 Offline Analysis; 5 Emergency Mode.

• Legacy uses one worker, reduced history and slow refresh, disabling heavy visual/satellite work while retaining core markets, headlines, telecom, weather and friction.

Completion gates

• Versioned historical warehouse with provenance and revisions.

• Leak-free feature tables and expanding-window evaluation against naive/autoregressive/single-factor baselines.

• Promote only stable out-of-sample improvement; monitor data, source and model drift.

Target operating flow

```
REAL SOURCES
 -> validated observations
 -> deduplicated/corroborated events
 -> geography + network topology
 -> confidence/freshness
 -> bounded domain states
 -> kinetic/transmission merge
 -> interactions
 -> inflation/risk/liquidity/growth models
 -> global + country C_t
 -> asset forecasts + uncertainty
 -> deterministic signal
 -> explanation
```

Validation boundary

Live endpoints, credentials, real topology data and aligned historical training data were not supplied. Generated modules were syntax-checked, but live operation and fitted forecast performance are not claimed.
